CURRENT EVENT OF THE WEEK

A new NOAA study published Wednesday in the journal Science Advances found that over the past four decades, a 50% decrease in aerosols — tiny particles of air pollution — over North America and Europe led to a 33% increase in the number of tropical cyclones in the North Atlantic. Over the last 40 years, Europe and North America have been leaders in reducing particulate air pollution from industry, autos, energy and other sources. The increasing absence of human-caused air pollution in the Northern Hemisphere has led to surface warming over the tropical Atlantic Ocean, which contributes to more frequent tropical cyclones. Without significant amounts of particulate pollution to reflect sunlight, the ocean absorbs more heat and warms faster. A warming Atlantic Ocean has been a key ingredient to a 33-percent increase in the number of tropical cyclones during this 40-year period.
