Nuclear Fusion versus Nuclear Fission

Presentation by John Carr, 12 February 2023, to Ecomodern Society of North America

- Physics of Fusion and Fission
- Magnetic Confinement Fusion
- Examples of Current Status
- History of Fusion and Fission Development
- Mainstream Fusion Reactor
- Fusion and Fission Power Plants
- Fusion Propaganda
- Pros and Cons of Fusion and Fission
- Radiation Damage and Neutron Activation
- Safety
- Physical Size
- Reliability / Availability
- Costs of Fusion
- Show-Stoppers for Mainstream Fusion
- Why bother with Fusion rather than Fission?
- Website: Climate and Hope

Physics of Fusion and Fission

Fusion

Fusion of deuterium and tritium Requires heat to initiate interaction

Fission

Fission of uranium nucleus Initiated spontaneously by decays

- Fusion power plant would need to be much more complex than fission power plants.
- Also much bigger.
- Consequently much more costly.

Magnetic Confinement Fusion

Plasma confined in a system of magnetic fields

Examples of Current Status

Fusion

ITER, International Thermonuclear Experimental Reactor 1 Prototype fusion reactor in construction

Fission

Penly, Fission Nuclear Power Plant

2 fission reactors in operation + 2 in planning

History of Fusion and Fission Development

• 4000	Fusion	Fission
1930	Physics understood, 1930s	Physics understood, 1930s
1940		First experimental reactor, Chicago Pile-1 1942 First bomb, Trinity 1945
1950 1960	First bomb, Bravo 1954	First commercial power plant, Shippingport 1957
-1970 1980	Many experiments exploring different techniques Eventually Tokamaks emerge as favoured device	200 commercial reactors 1977 Three Mile Island accident, 1979
1990		Chernobyl accident, 1986 416 commercial reactors 1990
2000	First experimental tokamak with fusion reactions, TFTR 1997	
2010	Most global efforts devoted toward ITER	Fukushima accident, 2011 442 commercial reactors 2020
2030	Private fusion companies claim commercial fusion 2030s ?????	
2040	First prototype reactor with fusion reactions, ITER, 2040 ?	
2050	First prototype power plant, DEMO, 2060- 2080 ???	

Mainstream Fusion Reactor

- Magnetic confinement with Tokamak.
- Deuterium tritium fuel.
- Tritium hardly exists in nature and world stocks come from CANDU fission reactors.
- Tritium must be regenerated in machine.

Tokamak fusion power plants have many complex ancillary systems

Fusion and Fission Power Plants

Fusion

Fission

EU-DEMO design can only be finalized after ITER success. Operational 2060-2080 ???

New nuclear construction program in France. 14 new reactors operational between 2035-2050

Fusion Propaganda

No long-lived radioactive waste: Nuclear fusion reactors produce no high activity, long-lived nuclear waste. The activation of components in a fusion reactor is anticipated to be low enough for the materials to be recycled or reused within 100 years, depending on the materials used in the "first-wall" facing the plasma.

Limited risk of proliferation: Fusion doesn't employ fissile materials like uranium and plutonium. (Radioactive tritium is neither a fissile nor a fissionable material.) There are no enriched materials in a fusion reactor like ITER that could be exploited to make nuclear weapons.

No risk of meltdown: A Fukushima-type nuclear accident is not possible in a tokamak fusion device. It is difficult enough to reach and maintain the precise conditions necessary for fusion-if any disturbance occurs, the plasma cools within seconds and the reaction stops. The quantity of fuel present in the vessel at any one time is enough for a few seconds only and there is no risk of a chain reaction.

It is important to counter the anti-fission implications.

BRINGING THE POWER OF THE SUN TO EARTH

Fusion machines are inherently safer posing very low risk to populations in the vicinity, generating no long-lasting waste.

Commonwealth Fusion Systems

Limitless

One glass of water will provide enough fusion fuel for one person's lifetime.

Pros and Cons of Fusion and Fission

	Fusion	Fission
Status	Research for 70 yrs	Operational for 70 yrs
Reliability	Major doubt	>80% of time
Carbon Emissions	None	None
Fuel availability	Tritium scarce	Uranium abundant
Radioactive waste	Mostly short lifetime	Partly Long lifetime
Safety	Complex systems	Historic accidents
Cost *	\$22000/KW	\$6000/KW

* Impossible to give accurate costs for fusion because no complete power plant design exists

Ultimately, cost of power generation system will decide which is used.

Radiation Damage and Neutron Activation

- Neutron flux in fusion reactor is higher than in fission reactor for same power.
- Neutron energy is much higher.

Radiation damage

Neutron activation

Higher volumes of radioactive waste from fusion reactor

Safety

Analysis of safety risks essential but complicated activity with numerous aspects.

Hydrogen explosions after coolant loss are biggest dangers for both fusion and fission reactors

ITER assembly has been on hold since January 2021 because of concerns raised by the French Nuclear Safety Authority (ASN)

Physical Size

Fusion Reactor "cores" must be enormous compared to fission reactor cores. because of low energy density of fusion reactions in plasma.

Reliability / Availability

Fusion Power Plants will have large downtime due to:

- breakdowns of complex systems
- extensive scheduled maintenance to replace radiation damaged components

Fusion 30% Fission 90%

Fission 3 times higher capacity factor

Costs of Fusion

- Construction costs: factor 4 more than fission
- Availability: factor 3 less than fission
- Operational costs larger because of extra complexity and more maintenance.

- · Magnets & power supply
- Replaceable in-vessel components (blanket, divertors)
- Building (Active Maintenance Facility)
- Miscellaneous plant (Tritium handling systems)

Conclusion is that the costs of a mainstream fusion power plant are unknown at the present time but certainly will be much higher than fission by more than a factor 10.

Show-Stoppers for Mainstream Fusion

- Lack of tritium fuel
- No suitable materials
- Impossible Size

Why bother with Fusion rather than Fission?

Only reason for fusion power plants would be public opposition to fission power plants. Fission is one of the safest and cleanest sources of energy.

Even if all the difficulties can be overcome, fusion would have no significant advantages over fission and would cost 10 times more.

We should work to ensure that fusion advocates do not distort the truth.

SAFETY OF FUSION COMPARED TO FISSION

Safety is often evoked to suggest that fusion is preferable to fission, but many risks exist

for fusion reactors which are similar to those of fission reactors. A major risk for both

After decades of research, most efforts towards fusion power are based on magnetic

fusion power plants before the final goal of commercial fusion power plants.

confinement fusion with tokamak devices. The ITER machine, in construction since 2010.

is the latest such device and it is planned to follow on with a number of demonstration

The Breeder Blanket is the most critical and complicated component of a fusion reactor

because of the dual functions of heat extraction and tritium breeding. Much remains to be done for the decision on the optimum technology and this necessitates a dedicated

on and fusion is loss of coolant followed by hydrogen explosions

WILL FUSION POWER EVER WORK?

Nuclear Fusion is often presented as the Holy Grail of electricity production. This website shows why building a fusion power plant is very difficult to achieve and may never become a reality.

IMMENSE CHALLENGES FOR NUCLEAR FUSION REACTORS

This page introduces the many immense challenges for tokamak fusion power plants using deuterium-tritium fuel. Some of the problems discussed for commercial fusion may be insurmountable

ESSENTIALS OF NUCLEAR PHYSICS

A basic knowledge of nuclear physics is required to properly understand the issues related to the generation of electricity from nuclear reactions. This page gives an introduction to essential concepts which will be used in later pages of the website.

ESSENTIALS OF PLASMA PHYSICS

The understanding of controlled nuclear fusion on Earth requires some knowledge of the physics involved. This page explains some basics ideas needed to follow the subsequent discussions on this website.

NUCLEAR FUSION AND NUCLEAR FISSION

Two possibilities for nuclear power generation exist, one in operation for 70 years. fission, and one which has been in development for the same period, fusion. Features of fusion and fission power production are compared showing advantages claimed by fusion advocates are exaggerated.

REACTOR COSTS, FUSION COMPARED TO FISSION

The cost of fusion, relative to other electricity sources, will be the primary decider for commercial power. Estimates from literature are presented, together with new estimates based on simple arguments. The conclusion is that the cost of fusion is likely to be 10 times more than fission

RADIOACTIVE WASTE

The neutrons from fusion reactions make certain materials radioactive via neutron ation. This will produce large volumes of radioactive waste which must be managed

MATERIALS AND RADIATION DAMAGE

The materials in a reactor must survive damage from the enormous flux of neutrons emitted from the fusion reactions. This problem is as yet unsolved and with current materials reactor components will have to be replaced on a regular basis.

BREEDER BLANKET

test facility.

TOKAMAK FUSION REACTORS

MAINTENANCE, BREAKDOWNS AND AVAILABILITY Because of the system complexity, the time a fusion power plant is fully operational to produce electricity could be low. The fusion reactor availability will be reduced by necessary scheduled maintenance as well as component breakdowns.

PHARAONIC SIZE AND BYZANTINE COMPLEXITY

The enormous physical size of the ITER tokamak and the complexity of the associated

systems required for operations, raise serious doubts that commercial reactors of even bigger scale could ever be viable.

ESSENTIAL TEST FACILITIES

The developments of materials and tritium breeder blankets for fusion reactors lack progress. These developments require special test facilities which provide a flux of neutrons similar to that of an operational fusion reactor. No adequate test facility is yet in operation

TIMESCALES ADVERTISED FOR COMMERCIAL FUSION POWER PLANT

After ITER, plans diverge around the world for arriving at commercial fusion power Schedules towards the construction of mainstream fusion power plants in a number of countries are presented

SHOW-STOPPERS FOR MAINSTREAM APPROACH

The mainstream approach toward commercial fusion reactor has major "show-stoppers". This page summarizes problems discussed throughout this website.

ALTERNATIVE APPROACHES

Alternative approaches exist to the mainstream fusion methodology of tokamaks and deuterium-tritium fuel. Recently, start-up companies have been launched based on private finance to explore these new approaches. The new ideas include innovations to magnetic confinement fusion as well as inertial confinement fusion and hybrid techniques.

WHY BOTHER WITH FUSION RATHER THAN FISSION?

Fusion power only really makes sense if it has clear advantages over fission power Fusion advocates claim this is the case, but this page summarizes the arguments that fusion has, in fact, no significant advantages over fission

COMMERCIAL FUSION WILL LIKELY NEVER HAPPEN

The final conclusion of this website is that nuclear fusion commercial reactors will never be competitive with nuclear fission reactors. For this and other reasons commercial fusion reactors will never come into service.

Feedback welcome johncarr@orange.fr

DIVERTOR AND LIMITER The divertor is the device which implements the exhaust of the plasma at the end on a confinement cycle. The limiter scraps the edge off the plasma in disruptions and ts the role of the divertor. These components have the highest radiation damage in the tokamak because of the high dose of neutrons they receive.

SUPERCONDUCTING MAGNETS Superconducting magnets are the core enabling technology for magnetic confinement fusion reactors. The reliability of the magnets is essential for the operation of a fusion power plant.

Questions?

Inertial Confinement Fusion

A system of lasers focus light on a small target pellet with deuterium-tritium fuel which implodes to make fusion reactions

Very complicated and expensive Not clear how the repetition rate can be fast enough for a power plant

Private Fusion Companies

Company Name and website	Technology	Fuel	
Commonwealth Fusion Systems	Compact Tokamak	D-T	
TAE Technologies	Field Reversed Config.	p- ¹¹ B	
Helion	Magneto-inertial	D- ³ He	
General Fusion	Magneto-inertial	D-T	
Tokamak Energy	Spherical Tokamak	D-T	
Zap Energy	Sheared flow Z-Pinch	D-T	
ENN	Spherical Tokamak	p- ¹¹ B	
The seven private fusion private companies with funding >\$200 million by 2022			

Alternative Fuels						
Fuel	k_BT_i	$k_B T_e$	$\langle \sigma v \rangle$	$p_{\rm fusion}/p_{\rm brem}$		

Fuel	k_BT_i	$k_B T_e$	$\langle \sigma v \rangle$	$p_{\rm fusion}/p_{\rm bren}$
D–T	$50 \mathrm{keV}$	$42 \mathrm{keV}$	$8.7 \times 10^{-22} \ {\rm m}^3/{\rm s}$	139
D- ³ He	$100 \mathrm{keV}$	$73 \mathrm{keV}$	$1.7 \times 10^{-23} \text{ m}^3/\text{s}$	6.6
D–D	$500 \mathrm{keV}$	$209 \mathrm{keV}$	$2.0 \times 10^{-22} \text{ m}^3/\text{s}$	2.9
$p_{-11}B$	$300 \mathrm{keV}$	$137 \mathrm{keV}$	$2.4 \times 10^{-23} \text{ m}^3/\text{s}$	0.57

ITER Failure?

The international ITER project is putting all mainstream fusion eggs in one huge, complicated basket. If ITER fails, it will be noticed by politicians everywhere and a restart of a similar fusion project will be impossible. There are many paths by which ITER could fail:

- Plasma Physics. The primary goal of ITER is to finally solve the problems with plasma confinement and disruptions. If it fails here, it is unlikely there will ever be a new bigger project with the same role.
- Technical Fault. Any number of engineering issues could lead to project failure. One risky decision that has been taken, is to skip power tests of superconducting magnets. After the tokamak is completely assembled a repair of the magnet coils would be impossible without several years of work. Recently, leaks in the partly assembled thermal shields have been discovered and these leaks can now be repaired but would have been impossible after complete tokamak assembly. Possibly other technical gambles have been made.
- Political collapse. The multinational structure of ITER is slowly being eroded for numerous reasons. The current funding arrangement ends in 2035 and some significant extension will be needed. This might not happen.
- Nuclear Regulatory Rejection. ITER is licensed by the French nuclear safety authority (ASN). Agreement by ASN must be given at certain stages of ITER construction. Between, January-December 2022 ITER construction has been stopped because of objections of ASN. The progress of ITER towards completion depends on ASN approval and safety concerns might halt ITER.
