 ☞ ***: By following the spin and flux evolution of a ULXP we showed for the first time that spin up of the NS is constant even though flux changed by a factor of 50, thus flux modulations are related to absorption and obscuration rather than changes in accretion rate.

A spectacular result was that by analyzing archival data over 4 years we found that the NS spin has changed from 126 to 18 seconds over that period, making it the fastest evolving NS ever observed.
